

Saves clean up time, Cuts down material loss and reduces equipment maintenance costs. Dustbuster 4 assists in providing a cleaner safer environment and a more cost effective use of scarce water resources. Reduce water consumption by up to 200%.

Water/chemical solutions designed for dust suppression are applied to allow the water droplets to capture fines, holding them in the main body of material on the conveyor. When applying water to conveyors care has to be taken not to apply too much water as this can cause operational problems, belt slippage, fines build up in chute areas and at transfer points. Dustbuster 4 has been formulated to promote good dust control by reducing the amount of water needed to provide good dust suppression and improve operational procedures.

Dustbuster 4 is a cost effective solution, it is applied at the rate of 1 litre to 2000 litres of water. This lowers the surface tension of the water there by allowing the mixture to control finer dust particles. More material is retained on the belt

Dustbuster 4 is supplied in 200 litre drums or 1000 litre IBCs
